MAKING THE DIAGNOSIS

With the growing number of scholarly articles on T replacement therapy helping physicians and lay people alike overcome the knowledge barrier, the next step is clarifying the diagnosis. The most important clues come from the patient’s own history. “When I hear a man say ‘The sofa speaks to me,’ I am concerned,” Dr. Morgentaler said. “So often I hear variations on that theme—men just find that their new ‘normal’ level of activity is much lower than it used to be. They have trouble focusing, staying on top of their game. I see men from all walks of life, often those whose careers have been built on being sharp, on asking incisive questions, on making snap decisions—and they’re finding they just have trouble doing those things.” As we’ve seen, mood can also be affected—it’s well known that men with low T are more prone to depression. Beyond depression, my patients also frequently complain of dramatic mood swings,” Morgentaler noted.

Blood levels are an important part of the diagnostic process too—but it isn’t entirely black and white. “While we currently don’t recommend that every man undergo regular testosterone checks as a screening test,” Morgentaler noted, “We do need to get primary care doctors thinking about the diagnosis in an increasingly broad way. Men who complain of fatigue, poor focus, and low energy levels, in addition to those with purely sexual complaints, should have their T levels checked. Not all will have low T, of course, but we know that we’re missing a very large number of people at present.”

TESTOSTERONE THERAPY

- Men with diminished sex drive, energy, and enthusiasm for life may be suffering from low testosterone levels (“Low T”).
- Testosterone levels drop with advancing age—but that doesn’t mean the consequences are an inevitable part of aging.
- Harvard urologist Dr. Abraham Morgentaler has led the scientific effort to better understand how low T impacts a man’s overall function, performance, and even longevity.
- Most doctors still subscribe to the myth that T replacement increases the risk of prostate cancer, so they may resist treating their patients appropriately.
- Testosterone for Life, the new book by Harvard expert Dr. Abraham Morgentaler, documents the life-changing effects of safe, responsible testosterone replacement therapy (TRT).
- Morgentaler busts the T replacement-prostate cancer myth—and even provides evidence that it is safe in men at high risk for cancer.
- Men with low T (and their families) can enjoy enhanced quality of life with simple, effective, and easy to use T replacement therapy.

As with any other blood test, it’s important to know what the “normal” levels are, and how they apply to an individual. “According to the FDA, “a ‘normal’ total T level is 300 ng/dL,” says Morgentaler. “Strictly interpreted that would mean that a man with a level of 299 is low, while a man with a level of 301 is normal. That’s simply not a sensible approach. The Endocrine Society, a very august group, has produced guidelines that mirror the FDA, though they do point out that no single number should be used and that symptoms should guide the diagnosis. The International Society for the Study of the Aging Male uses a higher number, 348. The point is that we need to interpret these numbers in the context of a man’s signs and symptoms.” In other words, if a man’s symptoms are consistent with low T and his level is anywhere near the low end of these scales, he and his physician should consider a trial of T replacement therapy.

According to Dr. Morgentaler, “Which tests are done, where they are done, and how they are reported also matter. Most primary care physicians use local laboratories, which can be inaccurate and arbitrary in their ‘normal’ reporting range. We pulled 25 hospital laboratories’ reference ranges at random, and found 17 different low and high ‘normal’ values.” Worse, none of these values were based on symptoms—they were based simply on standard deviation from average levels in the population. “In a population with 10% of men with truly low T levels, this approach means you’d miss three-quarters of them with standard testing,”
An important consideration, though, is that production of sperm will decrease during treatment if approved by the FDA it will be called Aveed™ (it is known as Nebido® outside the US), and it is good for 2.5 months. This product is ideal for men who’ve had a favorable response to treatment, and just want to continue with good T levels without having to fuss with other dosing forms,” Dr. Morgentaler remarked.

What’s on the horizon? “A long-lasting injectable form of testosterone, called testosterone undecanoate, may soon be available—if approved by the FDA it will be called Aveed™ (it is known as Nebido® outside the US), and it is good for 2.5 months. This product is ideal for men who’ve had a favorable response to treatment, and just want to continue with good T levels without having to fuss with other dosing forms,” Dr. Morgentaler remarked.

What about side effects? “Testosterone therapy is safe,” Dr. Morgentaler stressed, “because unlike most pharmaceuticals, testosterone is a naturally occurring product of a man’s body. The replacement hormone is identical to endogenous testosterone. We see fairly minimal side effects of appropriate treatment: some minor swelling and tenderness of the breasts, and occasionally some acne breakouts occur. T therapy may also cause elevation of red blood cell counts, but there have been no reports of stroke or other related adverse effects.4 An important consideration, though, is that production of sperm will decrease during treatment, and testicular size may also decrease. All reported side effects go away as soon as treatment is stopped, which is also reassuring.” And unlike the effects seen in body builders who use high-dose androgen injections that include non-testosterone hormones, “T therapy doesn’t cause kidney, liver, or cardiovascular disease. We monitor our patients by checking

SO YOU HAVE LOW T—WHAT CAN BE DONE ABOUT IT?

Fortunately, once the diagnosis has been made on the basis of concerning symptoms and low or low-normal T levels, treatment is fairly straightforward. “We have many options for treatment of men with low T,” Dr. Morgentaler observed. “There’s no recommended pill available in the US—there are some old ones still around that are not very effective and they are associated with significant liver toxicity, so no one should be using them for TRT.” But just about every other route has been explored.

“I usually start a man on a fairly short-acting form of T replacement,” Morgentaler continued, “so that we can gauge the effects together and make adjustments as needed. The market leader in this area is the testosterone gel, which is easy to use and has minimal skin reactivity. A man just showers, dries, and then applies the gel to the upper arms or shoulders. It’s absorbed very rapidly, so there’s no need to cover the area with a dressing of any kind. Men like the gel because it’s convenient, and we like it because it delivers reliable blood levels of testosterone quickly.”

The gel will probably replace the still-available transdermal patch, still in use especially by the Veterans Administration. “The patch is easy to use, but it causes a significant amount of skin irritation,” says Dr. Morgentaler, “and it doesn’t produce great blood testosterone levels.” There’s also the injection route—an intramuscular shot given every 2 weeks. “The advantage,” Morgentaler notes, “is that we always get adequate levels this way—but of course it requires biweekly shots which most people don’t like.”

In a revival of an old technique (remember the lizard experiments), time-release implants are now available as well. These are inserted just under the skin in the buttocks—we use 8-10 rice grain-sized pellets that slowly release T into the circulation. They produce great levels, there’s no ongoing maintenance required, and they are fully-absorbed, so never need to be removed,” says Morgentaler.

Finally, in terms of readily-available options, there are oral pastiches—tiny tablets that are placed between the cheek and gum. “They’re not visible to others,” Dr. Morgentaler points out, “and you just switch them every 12 hours.” These may be a good option for men who are uncomfortable with gels, injections, or implants.

Physicians may also need some reminding about which test to order for testosterone. Like other sex hormones, testosterone is found in the blood largely bound to a protein called sex hormone-binding globulin, or SHBG. But it’s the “free” testosterone that actually affects risk and performance, and standard testing measures only total T (free plus bound). “Physicians need to order both total and free T levels when they do their testing,” says Morgentaler. “If either one is low or in the ‘low normal’ range in a man with symptoms consistent with low T, then treatment should be considered.” Do doctors need to send this test out to specialized labs? “Not at all,” responded Dr. Morgentaler. “Most labs can do both tests—physicians just have to know to order them.”
T THERAPY AND PROSTATE CANCER

With diagnosis simplified and so many safe treatment options available, why are only about 5% of men with low T getting appropriate care? There’s a persistent fear of prostate cancer, and the belief that T therapy causes the disease continues to influence physicians and patients alike. “Most of my research and scientific writing has been on the purported relationship between T therapy and prostate cancer,” Dr. Morgentaler said. “The concerns have a historical basis—it’s long been known that reducing testosterone or its effects in men with metastatic prostate cancer makes the cancers smaller and slows their growth. That, perhaps naturally, led to the assumption that increasing testosterone would make the cancers larger and speed their growth.”

But in the past ten years, Morgentaler and other scientists have been aggressively challenging that assumption. “Long-term studies looking for increased incidence of prostate cancer in men with naturally high T levels have consistently failed to show any relationship at all,” notes Morgentaler. “Other studies showed that PSA was unchanged in men who received treatment that increased their T levels to more than twice the ‘normal’ range.” In fact, Dr. Morgentaler has published data showing that men with significant reductions in testosterone levels actually have an increased risk for prostate cancer!18

Other world-class researchers have become interested. A “pooled data” study by dozens of scientists in the Endogenous Hormones, Prostate Cancer Collaborative Group and published in the Journal of the National Cancer Institute reviewed 18 prospective studies that included 3,886 men with prostate cancer and 6,438 control subjects.19 The studies had all evaluated the risk of prostate cancer and levels of total and free testosterone as well as other sex hormones. The conclusion? “In this collaborative analysis of the worldwide data on endogenous hormones and prostate cancer risk, serum concentrations of sex hormones were not associated with the risk of prostate cancer.”

“More and more placebo-controlled studies are showing no increase in prostate cancer in men actually receiving T therapy,” Dr. Morgentaler noted. “So far these are only short-term studies because we just haven’t been doing it long enough,” he continued, “but the longitudinal studies are so strong that I believe the question has been answered firmly.” Does T therapy cause increases in PSA (the marker for early prostate cancer)? “There’s no difference between PSA ‘trigger events’ (PSA over the threshold of 4 ng/dL) in men receiving T replacement and those who aren’t,” Morgentaler said, citing data both from his own work20 and another pooled meta-analysis study.21

Based on the overwhelming wealth of data, Dr. Morgentaler is now beginning to provide T replacement therapy to men who’ve had prostate cancer—something that would have been anathema just a few years ago.22 Other experts are beginning to follow suit.23,24 Even more impressively, Morgentaler and his colleague Emani Rhoden at Harvard have also begun T therapy in men at high risk for prostate cancer—men who have biopsy-proven prostatic intraepithelial neoplasia (PIN), which is considered to be a precancerous condition.25 This is more than just good science—Morgentaler’s work is providing improved quality of life for men who thought they’d seen the last of their male vigor. “I saw an 84-year-old man with prostate cancer,” recalls Morgentaler. “He wasn’t interested in treating the cancer at his age, and he wanted T therapy because he was interested in the benefits. Two years later he’s actually seen a decrease in his PSA levels, and more importantly, he feels great!”

Cautionary note: Although quite a number of urologists and oncologists will now offer TRT to men with a history of prostate cancer, primarily after successful treatment of the cancer, many others are still concerned that treatment may increase the risk of cancer recurrence. And language mandated by the FDA for all commercial testosterone products advises against using TRT in men with any history of prostate cancer. The field still awaits large studies to determine the degree of safety of TRT in men with prostate cancer.

SUMMARY

Dr. Morgentaler closed our discussion with this summary of where we are with T replacement therapy: “Low T is common—much more so than most people realize. It has effects far beyond the very important impact on sexual function; in fact low T is associated with everything from atherosclerosis to the metabolic syndrome to male osteoporosis. And men with low T simply don’t feel good, and they don’t know why. Low T is vastly under-treated, yet T replacement therapy is safe and rapidly effective—we typically see results within weeks of starting treatment. I believe that any man over the age of 50 who feels run-down, off his game, or has any of the other symptoms of low T owes it to himself and his family to have his T levels checked, and if they are low, to be treated.” The final words in Morgentaler’s book say it eloquently: “We always have choices when it comes to our health. For many men with low T, learning about the condition and finding help to treat it is a good choice—a choice for life.”
