Matrix Repatterning (MR) was developed by Dr. George Roth as the result of his pursuit of a consistent and congruent system to assess and treat structural dysfunction at its most profound level. It is a revolutionary, easily learned method to accurately locate primary restrictions anywhere in the body and release them gently and permanently. He has been teaching this program since 1993 and the seminars are currently co-sponsored by Logan College of Chiropractic.

The matrix refers to the now well-established structure of organic tissue, based on the research of Ingber, Levin, Wang, etc. This structure is composed of a lattice of protein filaments, held together in a continuous, pre-stressed framework, defined by the term tensegrity (a combined word, coined by Buckminster Fuller, meaning tensional-integrity). It has been shown that this structure exists at every level, right down to the cytoplasm and the DNA.

Dr. Roth’s new book, The Matrix Repatterning Program for Pain Relief, is due out in the fall of 2004 (New Harbinger Publications). It is intended to provide information on Matrix Repatterning for the public, in order to demystify the issue of structural imbalance and provide the individual with basic tools to help overcome musculoskeletal pain.
